

## Features:

- Compliant with SFP MSA standard
- 3.3V DC power supply
- TX 1550nm FP/RX 1310nm PIN-TIA, 155Mbps, 40Km
- Difference LVPECL inputs and outputs
- Bi Direction LC connector
- Compliant with SFF-8472
- Hot Pluggable
- ROHS compliant

## Application:

- Fast Ethernet data link
- Data storage networks
- Other optical links
- Optical access network

## **Description**

Honlus 155Mbps single-mode BiDi SFP is a high performance and cost effective transceiver. It is designed to meet Fast Ethernet application. The transceiver consists Bi direction LC connector with TX in 1550nm DFB laser diode (LD) with monitor photo detector (MPD) in eye safety and RX in InGaAs PIN-TIA with 4PIN/5PIN structure. The output of the PD drives the post-amplification, quantizing, and optical signal detection circuits. The receiver is built in the LOS monitoring function. For further information, please see SFP MSA and SFF-8472 standard.

Note:

- 1, TX Fault is an open collector output, which should be pulled up with a 4.7k~10k\_ resistor on the host board to a voltage between 2.0V and Vcc+0.3V. Logic 0 indicates normal operation; logic 1 indicates a laser fault of some kind. In the low state, the output will be pulled to less than 0.8V.
2. TX Disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with a 4.7k~10k\_ resistor. Its states are:  
 Low (0~0.8V): Transmitter on (>0.8V, <2.0V): Undefined  
 High (2.0~3.465V): Transmitter Disabled  
 Open: Transmitter Disable
3. MOD-DEF 0, 1, 2 are the module definition pins. They should be pulled up with a 4.7k~10k\_ resistor on the host board. The pull-up voltage shall be VccT or VccR.  
 MOD-DEF 0 is grounded by the module to indicate that the module is present  
 MOD-DEF 1 is the clock line of two wire serial interface for serial ID  
 MOD-DEF 2 is the data line of two wire serial interface for serial ID
4. LOS is an open collector output, which should be pulled up with a 4.7k~10k\_ resistor on the host board to a voltage between 2.0V and Vcc+0.3V. Logic 0 indicates normal operation; logic 1 indicates loss of signal. In the low state, the output will be pulled to less than 0.8V.
5. These are the differential receiver outputs. They are AC-coupled 100\_ differential lines which should be terminated with 100\_ (differential) at the user SERDES.
6. These are the differential transmitter inputs. They are AC-coupled, differential lines with 100\_ differential termination inside the module.

### Power Supply

The Transceiver includes internal circuit components to filter power supply noise. Under some conditions of EMI and power supply noise, external power supply filtering may be necessary. If receiver sensitivity is found to be degraded by power supply noise, the filter network illustrated in the following figure may be used to improve performance. The values of the filter components are general recommendations and may be changed to suit a particular system environment. Shielded inductors are recommended.
